Trademarks

ImmunoCAP®, ImmunoCAP® InVitroSight™, Phadiatop®, EliA™, Varelisa®, Celikey®, Quality Club™ are trademarks belonging to Phadia AB.

All Phadia products mentioned herein are produced according to ISO 13485:2003.

Phadia AB

Phadia develops, manufactures and markets complete blood test systems to support the clinical diagnosis and monitoring of allergy, asthma and autoimmune diseases.

Besides strategic management, administration and business development, the international centre in Uppsala incorporates extensive research and development facilities, a production plant and distribution system operating cost-effectively around the clock.

In Freiburg, Germany, a second centre develops and supports diagnostic tests for autoimmune diseases.

Some 98% of production is exported to more than 3,000 laboratories in 60 countries.

Supplying seven out of ten allergy laboratory tests worldwide, the company has remained the world leader in its field for more than 25 years.

Total IgE

Total IgE measures the quantitative amount of total IgE in human serum or plasma. IgE antibodies are produced by the body as a result of repeated allergenic stimulation.

Specific IgE

ImmunoCAP Specific IgE provides an objective measurement of the circulating IgE antibodies and the sensitization to a specific allergen. Specific IgE antibodies appear as a result of exposure and following sensitization to an allergen. ImmunoCAP Specific IgE measure IgE antibodies to specific allergens in human serum or plasma and allows quantitative measurements of a wide range of individual allergens and allergen components. Over 600 different allergens are available for determinations.

Phadiatop®, Phadiatop® Infant

Phadiatop and Phadiatop Infant are tests that differentiate atopic and non-atopic diseases. It is the first step taken when testing for atopic allergy. The tests comprise a balanced mixture of relevant allergens that react with specific IgE antibodies in the patient serum.

Phadiatop and Phadiatop Infant demonstrate the presence of atopic allergy to common allergens relevant for adults and small children respectively.

Specific IgG

Specific IgG measures antigen-specific IgG antibodies in human serum and plasma. Specific IgG comprises antigen-specific antibodies of immunoglobulin class G. These antibodies are part of the natural defense system of the body and develop in the blood in response to contact with foreign substances. In autoimmune disorders, the antibodies are directed against self antigens (autoantigens).

Specific IgG4

Specific IgG4 measures antigen specific IgG4 antibodies in human serum and plasma. The measurements of Specific IgG and/or Specific IgG4 antibodies have been used in clinical studies of different allergic diseases such as asthma, rhinitis, urticaria, eczema and gastrointestinal disorders but also in different lung diseases, e.g. allergic alveolitis, aspergilloma and aspergillosis. In monitoring immunotherapy with inhalants and hymenoptera venoms increased levels of specific IgG and/or IgG4 are generally seen. It is generally believed that specific IgG and IgG4 antibodies are biomarkers of antigen exposure.

Specific IgA

Specific IgA measures antigen-specific IgA antibodies in human serum and plasma. Specific IgA antibodies are part of the natural immune defense system of the body. They are present in secretions such as saliva, in the mucosa, as well as in the blood. Levels of specific IgA increase when the immune system responds, for example, to a food allergen.

ECP

ECP measures the level of Eosinophil Cationic Protein (ECP) released in serum.

ECP is a highly cytotoxic protein found in eosinophil granules. Eosinophils are the cells chiefly responsible for producing the inflammation characteristic of asthma. When eosinophils in the airway are activated, they undergo degranulation causing airway epithelial damage and desquamation. This can increase hypersensitivity and lead to chronic inflammatory disease of the airway. ECP is released from the activated eosinophils during the inflammation process.

Tryptase

ImmunoCAP® Tryptase measures the total level of both alpha-tryptase and beta-tryptase in serum/plasma.

Mature beta-tryptase, stored in granula, is only released during mast cell activation. The transiently increased levels serve as a clinical marker confirming severe reactions as anaphylaxis.

The continuously release of tryptase into the blood reflects the number of mast cells.

Elevated baseline levels serve as a risk marker for certain sensitized patients to get into severe anaphylactic reactions, e.g. after bee/wasp sting or introduction of drugs.

Pathological levels of tryptase reflect the increased mast cell burden in several haematological disorders.

Allergen components

The term Allergen component is used for products based on molecular allergens purified from either their natural source (native) or biotechnologically produced as recombinant proteins.

By using tests for single allergenic components as a complement to more traditional IgE antibody tests, further clinically relevant information can be gained.

ImmunoCAP Allergen components are useful tools when investigating and explaining allergic reactions more in detail and to determine if they are caused by cross-reacting IgE antibodies to different allergens.

Immuno Solid-phase Allergen Chip

Based on modern biochip technology, ImmunoCAP ISAC® is a miniaturized immunoassay platform that allows for multiplex measurement of specific antibodies to many allergen components using only 20 µl of serum or plasma. Capillary blood sampling can be used, enabling a less invasive procedure for testing young children

Purified natural or recombinant allergen components are immobilized on a solid support (biochip). In a two step assay, antibodies from the patient serum bind to the immobilized allergen components. After a short washing step, allergen-bound antibodies are detected by a fluorescence-labeled antibody.

Test results are measured with a biochip scanner and evaluated using proprietary software. ImmunoCAP ISAC is a semi-quantitative test and results are reported in ISAC Standardized Units (ISU).

EliA

EliA is an enzyme immunoassay to measure autoantibodies for the diagnosis of autoimmune diseases such as rheumatoid arthritis, celiac disease or systemic lupus erythematosus. EliA runs on the fully automated systems Phadia® 100 and Phadia® 250 and makes the measurement of a broad panel of autoantibodies easy, reliable and economic.

The advantages of the Varelista microplate assay are:

- Breakaway microwells for maximum flexibility and cost effectiveness
- Maximum specificity and sensitivity by using recombinant antigens
- Short incubation times (30 - 30 - 10 minutes)
- Manual or automated assay procedure
- Room temperature incubations
- Quantitative and qualitative evaluation
- User friendly by ready-to-use reagents
- Objective values through computer-assisted evaluation
- Specimen: serum / plasma

Thyroglobulin IgG and Thyroid Peroxidase IgG

Thyroid autoimmunity comprises a number of distinct but pathogenically related immune disorders of the thyroid gland. The autoimmune response is dominated by anti-thyroid antibodies directed against the prohormone Thyroglobulin (TG) and Thyroid Peroxidase (TPO). ImmunoCAP® Thyroglobulin and Thyroid Peroxidase quantitatively measures IgG antibodies specific for Thyroglobulin and Thyroid Peroxidase respectively in human serum or plasma. These tests can be used as an aid in the clinical diagnosis of certain thyroid diseases, such as autoimmune thyroiditis and Graves' disease.

Gliadin IgA/IgG

ImmunoCAP® Gliadin IgA/IgG quantitatively measures IgA and IgG antibodies specific for gliadin in human serum or plasma. Measurement of circulating anti-gliadin antibodies can be used as an aid in the clinical diagnosis of patients with celiac disease and dermatitis herpetiformis, in conjunction with other clinical findings.

High productivity, automation and cost effectiveness

- Throughput: 60 tests/hour
- ImmunoCAP and EliA tests in one run
- Onboard dilutions
- Continuous random access
- All reagents stored on board
- 28-day storage of calibrations curves
- Connectable to Laboratory Automation Systems
- Remote diagnostics

True accuracy, high precision and outstanding quality

- Excellent consistency over time and between countries, systems, laboratories and users
- An allergen panel detecting sensitization to 600 allergens and 80 allergen components
- An autoimmunity panel for evaluation of over 20 diseases
- The largest quality assessment program in the world

Compare your lab performance

Demands for better quality assessment and performance standards are growing. So is Quality Club.

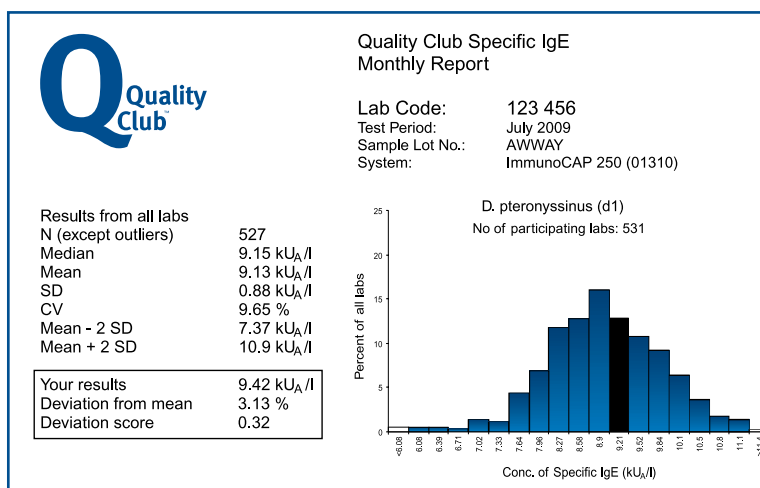

Health authorities throughout the world are striving to create performance and comparability standards. These ambitions require that diagnostic testing laboratories continuously assess their performance.

Phadia Quality Club is an international quality assessment program that helps participating laboratories meet this need. Today, more than 900 testing laboratories are active members and programs for specific IgE, total IgE, ECP and EliA Autoimmunity are currently available. Every month, these laboratories receive a detailed, confidential report of their performance and can compare their test results with others.

The well-documented information Quality Club provides helps them monitor performance and secure high standards of accuracy and reliability. Furthermore, it also helps gain the confidence of the physicians who send in samples for testing.

And all that's required is that once a month you assay a small number of control samples and return the results to us.

In addition, Quality Club membership gives priority access to local and international support teams. These experts are ready to discuss quality issues and lend direct, hands-on assistance if necessary.

Monthly reports show exactly how your testing measures up to results from other laboratories.

How to become a member

Quality Club membership is open to laboratories operating Phadia® Laboratory Systems.

For more information, simply contact Phadia.
